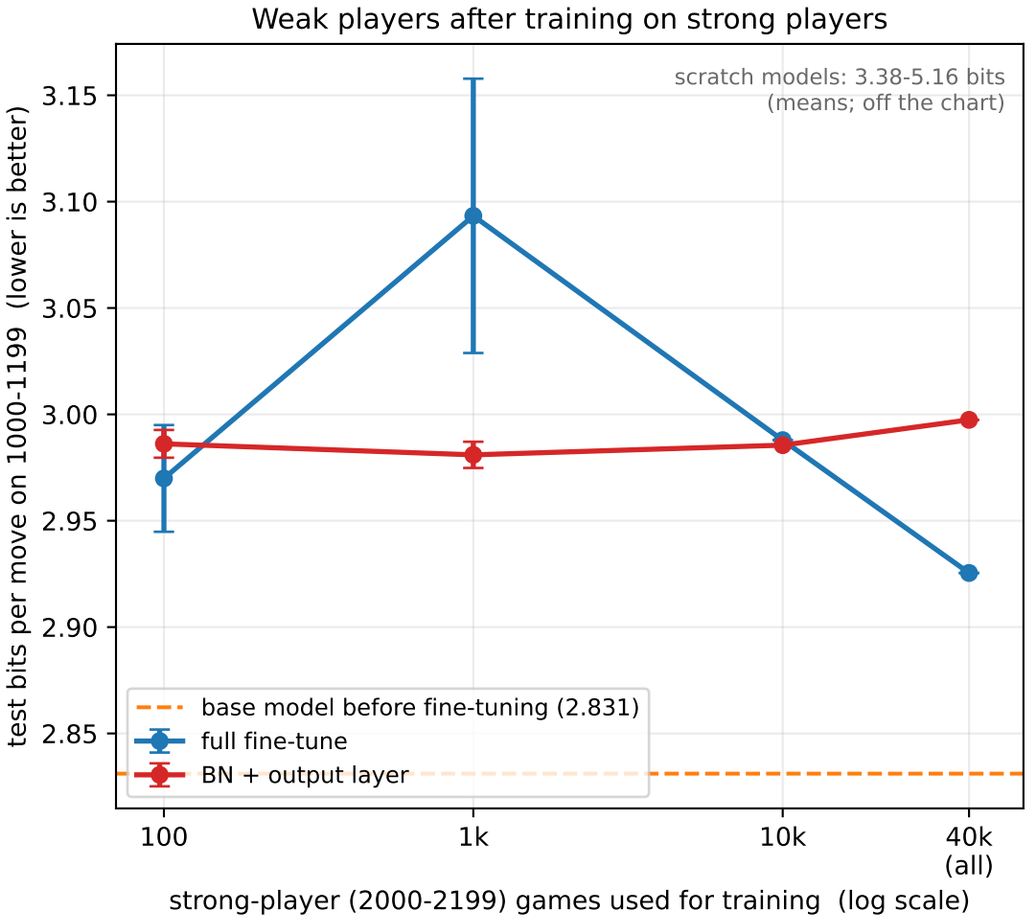
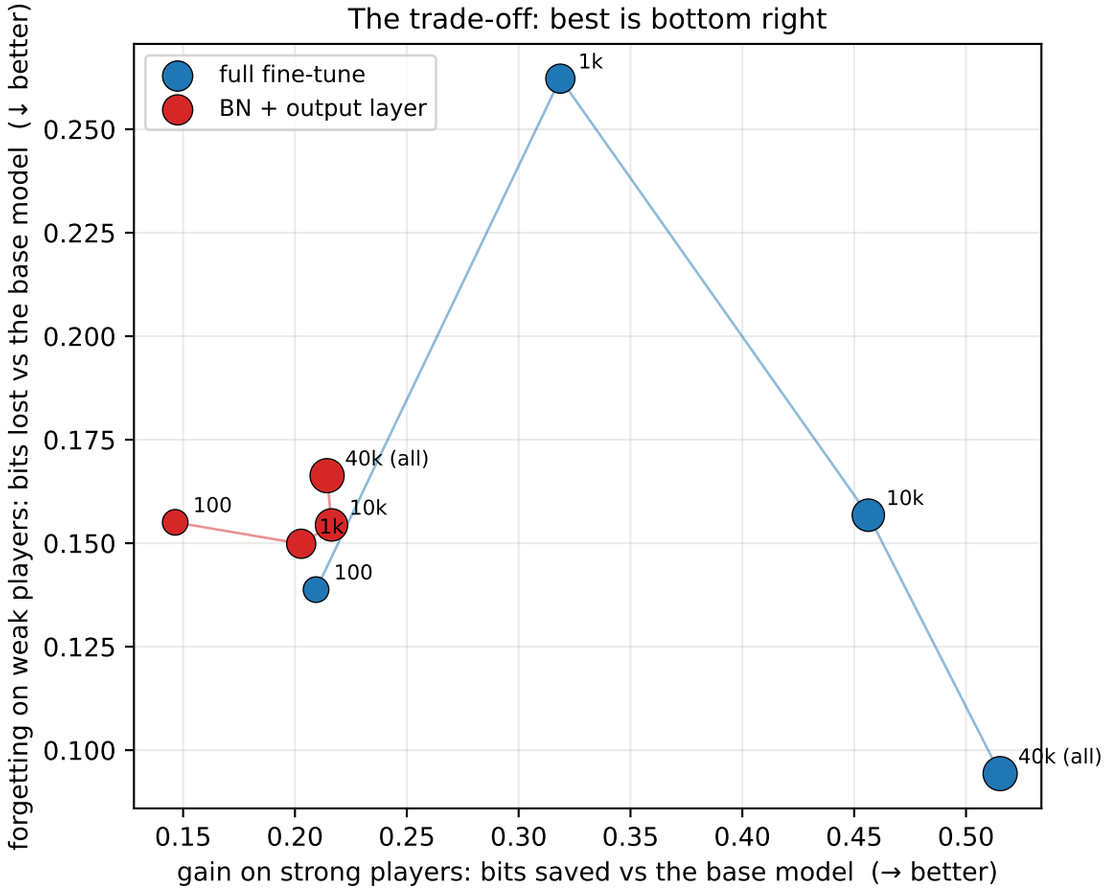
Fine-tuning on strong players costs 0.09-0.26 bits on weak players





Left: test bits on 28,654 held-out 1000-1199 positions after fine-tuning on N strong-player games (error bars ±1 sd over 3 seeds at N = 100 and 1k). Right: mean gain on 2000-2199 against mean forgetting on 1000-1199 for each N (point size grows with N). Forgetting does not fall steadily with N (full fine-tune: +0.14, +0.26, +0.16, +0.09 bits at 100, 1k, 10k and all games; one seed at 10k and all).
