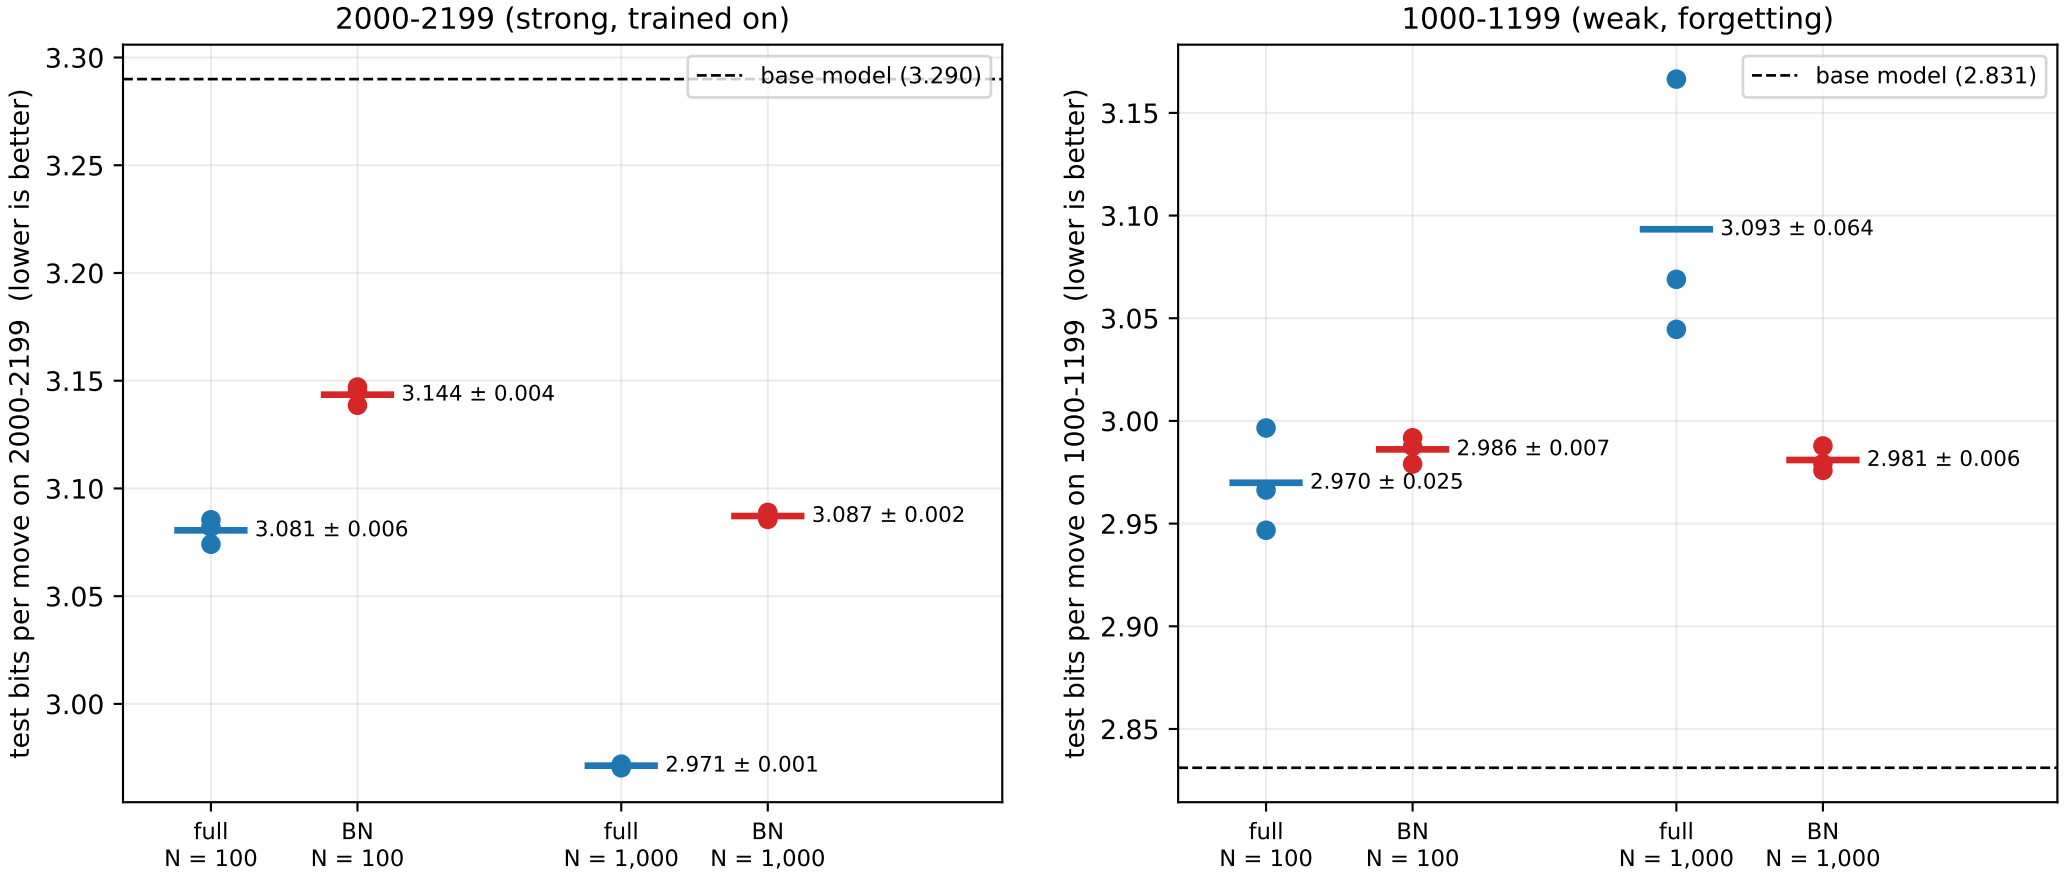
Fine-tune results barely depend on which games are sampled



Each dot is one seed (a different random choice of games and a different shuffling); the bar is the mean, with mean ± sd written next to it. On strong players the fine-tunes have a standard deviation of at most 0.006 bits and a range of at most 0.011 bits over 3 seeds. This spread leaves out test-set noise (487 test games). Scratch varies more (sd up to 0.024 on strong players, 4.5-6.0 bits on weak players), not shown to keep the scale readable.
